SafeWells

Expro's well integrity software, SafeWells, fundamental in ensuring early identification and timely resolution of issues for Marathon Oil

Objectives

- Marathon Oil recognised the need to develop an online database to capture their well integrity data for maturing assets in the North Sea – previously it was stored across the organisation by individual departments and would be time consuming to collate, resulting in inefficiencies when auditing, trending and reporting

Expro Excellence

- Expro's unique SafeWells well integrity management tool introduced to Marathon and subsequently implemented
- Working in conjunction with Marathon, Expro provided a systematic approach to well integrity management
- Ability to customise the SafeWells package specifically to Marathon's needs by the introduction of rules attached to questions regarding inflow pressures and pressure build ups; failures are automatically determined against preset rules; each is then rated and the accumulative score determines the integrity status of the well

Value to client

- The database has become a focal point to help facilitate Marathon's well integrity management processes and philosophies
- Expro worked within the customer's requirement to facilitate a seamless transition from the existing paper-based forms so that the online system had a similar look and feel
- The SafeWells system introduced a web-based database, which allows access to the same dataset by both well site and office personnel
- Data analysis capabilities were strengthened to analyse results and make informed decisions relating to both policies and procedures, and equipment reliability
- Real time well integrity with an auditable trail of operations and documentation is further enhanced by the ability to store additional electronic data such as certification, photographs or scanned pressure charts appended to the well or component
- Critical data is charted while 'triggers', specific to Marathon's policies and procedures, can be set on each data field to flag abnormalities ensuring relevant personnel are immediately informed of any problems

The systematic approach to well integrity management implemented ensures the identification and resolution of issues before they become long-term problems

Supporting Expro's well integrity services is SafeWells, a pioneering new well integrity data management solution. Developed by Expro in collaboration with industry, this software provides a clear overview of operators' well integrity status to address many of the challenges experiences relating integrity data.
